Petroleum cracking molecular sieve catalyst is a catalyst used in the oil cracking process, mainly composed of molecular sieve materials (such as zeolite). It promotes the cracking of oil molecules into lighter chemicals such as gasoline and diesel under high temperature conditions through its unique microporous structure and strong acidity. The role of oil cracking molecular sieve catalyst is to selectively break the macromolecular chains in crude oil and convert it into light oil products with higher economic value. This catalyst is widely used in the oil refining industry and is an indispensable key material in modern oil processing.
