Antacid hollow capsules are plant capsules that do not dissolve in the human stomach but dissolve in the intestines. Based on the different pH values of the stomach and intestines, they can be developed to control the content of the capsules to not be released in the human stomach, but to be targeted and released in the intestines. This not only protects the drug from being destroyed by stomach acid, improves the utilization rate of drug properties, but also avoids the stimulation of the stomach by the drug, protects the digestive organs and respiratory tract. Especially suitable for filling drugs that are prone to irritation to the stomach or are susceptible to gastric acid damage or enzyme breakdown in the stomach, as well as drugs that require targeted release in the intestine, such as probiotic capsules, which have a higher survival rate in plant capsules and are also targeted for release in the intestine; Animal dissolving intestinal capsules (omeprazole enteric coated capsules).
