The principal desiccants used in pharmaceutical applications are silica gel and molecular sieve. Silica gel is available in two main types: a white, non-indicating version and one that changes colour when moisture is adsorbed. The latter is obviously useful to indicate when the desiccant is used up. Self-indicating gels also have a number of varieties, the older blue-to-pink gels and the more recent yellow-to-green ones. Blue-to-pink gels contain cobalt chloride so are subject to legislation in Europe that requires a toxic hazard label. Yellow-to-green gels do not pose such health and safety issues. White-to-pink gels are also available but these contain phenolphthalein, a known carcinogen. Molecular sieve is a special type of desiccant that can reduce moisture levels to almost zero. Such desiccants are available in different pore sizes with varying capacities for moisture adsorption. Activated carbon, while not a desiccant, is often used to absorb odours.
