The global Pharmaceutical Grade HPMC market size is predicted to grow from US\$ 393 million in 2025 to US\$ 602 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Pharmaceutical-grade hydroxypropyl methylcellulose is a non-ionic type of cellulose mixed ether. From the perspective of the upstream supply chain, its core raw material is high-purity refined cotton. After being treated with alkaline solution, the refined cotton becomes alkali cellulose. Then, under strictly controlled pressure and temperature conditions, epichlorohydrin and chloroform are added for etherification reaction, followed by refining, washing, drying, ultrafine grinding, and packaging with pharmaceutical-grade cleanliness. Its downstream supply chain precisely focuses on modern pharmaceutical industry, health supplement manufacturing, and production of medicinal hollow capsules, etc., which are high-barrier fields. From global industry data, the overall production capacity of global pharmaceutical-grade hydroxypropyl methylcellulose in 2025 reaches 65,000 tons, while the actual global sales volume reaches 47,100 tons. In terms of price, the market-weighted average comprehensive price of global pharmaceutical-grade hydroxypropyl methylcellulose in 2025 is \$8,520.38 per ton. The global average profit margin of this independent sub-industry currently remains at 24.50%.

In the future, the production and research and development technologies in the global pharmaceutical-grade hydroxypropyl methylcellulose industry will fully shift towards customization degree, ultra-low impurity residue control, and a wider viscosity range. The core trend is to develop ultra-high viscosity controlled-release products and ultra-low viscosity quick-dissolving coating products for advanced drug delivery systems. At the same time, through process upgrades, the content of free methanol and propylene

oxide residues in the products will be minimized to fully comply with the increasingly strict global regulatory requirements for the review of genotoxic impurities. In terms of market driving factors, the vigorous development of the global generic drug market and the rapid increase in the penetration rate of innovative drug delivery systems in oral solids have formed the most stable industrial consumption traction for this core excipient. At the same time, with the awakening of global veganism, specific religious dietary cultures, and clean label health consciousness, the switch from traditional gelatin capsules to hydroxypropyl methylcellulose plant hollow capsules shows an irreversible explosive growth. Moreover, the surge in the demand for suspension stabilizers in modern ophthalmic drugs and targeted biologics has jointly constituted a strong double helix engine driving the continuous expansion of the market space for pharmaceutical-grade hydroxypropyl methylcellulose.
