Pharmaceutical lubricant excipients are excipients that play a lubricating role in pharmaceutical preparations. They typically have a low coefficient of friction and can form a lubricating layer between drug particles or between drugs and production equipment, thereby reducing friction and making it easier to process, mix, and compress drugs into tablets. Pharmaceutical Lubricant Excipients can also prevent drugs from adhering or wearing during the tablet pressing process, improving the appearance quality and stability of the drugs. Common pharmaceutical lubricant excipients include magnesium stearate, talc, and polyethylene glycol. The selection and usage amount of these excipients need to be determined based on the characteristics of the drugs and the production process to ensure the safety and effectiveness of the drugs.
