Pharmaceutical pH modifier excipients are excipients used in pharmaceutical formulations to adjust and control the pH value of drug solutions or suspensions. These excipients play a crucial role in pharmaceutical formulations, as they can affect the solubility, stability, and bioavailability of drugs. By adding appropriate amounts of pH modifier excipients, drugs can be stabilized within a specific pH range, thereby improving their efficacy and safety. The selection and use of Pharmaceutical pH Modifier Excipients need to be determined based on the properties of the drug, the type of formulation, and the physiological characteristics of the target patient population. Common Pharmaceutical pH Modifier Excipients include inorganic acids, inorganic bases, organic acids, and organic bases. The reasonable application of these excipients in pharmaceutical formulations can significantly improve the quality and therapeutic effect of drugs.
