Pharmaceutical thickener excipients are excipients used to increase the viscosity and thickness of pharmaceutical preparations. They typically have high molecular weights and can form a network structure or colloidal particles in drug solutions, thereby increasing the viscosity and thickness of the drugs and making them easier to apply, inject, or take orally. Pharmaceutical Thickener Excipients can also improve the stability and bioavailability of drugs, preventing them from stratifying or precipitating during storage and transportation. Common pharmaceutical thickener excipients include gelatin, sodium alginate, and sodium carboxymethylcellulose. The selection and usage amount of these excipients need to be determined based on the characteristics and uses of the drugs to ensure their safety and effectiveness.
