The pharmaceutical vacuum mixer is a kind of equipment used in the pharmaceutical industry, which is widely used in the manufacturing process of preparing drugs, pharmaceutical cosmetics and other related products. Vacuum mixers mix different ingredients together under low pressure by creating a negative pressure environment to ensure uniform mixing and high-quality finished products. Vacuum mixers usually

consist of a mixing vessel and a vacuum system. A mixing vessel is usually a sealed stainless steel tank or container with a mixing blade or stirrer inside that is used to mix the different ingredients together. The vacuum system creates a negative pressure environment by extracting the air inside the container. This helps remove air bubbles and oxygen in the air, prevents oxidation reactions from occurring, and ensures stability and quality during mixing.
