The global Phase Locked Loop Chip market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

PLL chip refers to a "Phase-Locked Loop" chip, which is an integrated circuit device used to generate an output signal synchronized with the frequency of a reference signal. PLL chips usually consist of phase comparators, phase-locked loop filters, oscillators and frequency dividers. Its main function is to continuously adjust the frequency of the internal oscillator to keep the phase of the output signal constant with the phase of the input reference signal to achieve frequency locking and adjustment of the signal. PLL chips are widely used in communication systems, radio frequency transceivers, digital clock generation and other fields to achieve functions such as signal synchronization and serial communication clock recovery.
