## Abstracts

The global Phenoxybenzamine Hydrochloride Tablets market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Phenoxybenzamine hydrochloride tablets are an  $\alpha$ -adrenergic receptor blocker, mainly used to treat hypertension caused by peripheral vasoconstriction, such as hypertensive crisis caused by pheochromocytoma. It blocks  $\alpha$ 1-adrenergic receptors, reduces peripheral vasoconstriction, and lowers blood pressure. In addition, phenoxybenzamine hydrochloride tablets can also be used to treat peripheral vascular diseases such as Raynaud's disease, improve blood flow and relieve symptoms. Due to its vasodilatory effect, this drug is mostly used for patients who need long-term blood pressure control.

As an effective  $\alpha$ -adrenergic receptor blocker, phenoxybenzamine hydrochloride tablets have unique value in the treatment of hypertension caused by peripheral vasoconstriction, especially hypertension caused by pheochromocytoma. By blocking the contraction response of blood vessels, it can significantly reduce blood pressure and relieve symptoms, especially for patients who require long-term blood pressure control. However, because its mechanism of action widely affects vascular tone and may be accompanied by side effects such as hypotension and increased heart rate, close monitoring is required during use.
