The global Phlegm Remover market size is predicted to grow from US\$ 612 million in 2025 to US\$ 885 million in 2031; it is expected to grow at a CAGR of 6.3% from 2025 to 2031.

A Phlegm Remover refers to any device, medication, or technique used to help clear or expel phlegm (mucus) from the respiratory tract, particularly the lungs, throat, or bronchial tubes. Phlegm is a thick, viscous substance produced by the mucous membranes in response to infections, allergies, or irritation in the respiratory system.

Pharmaceutical companies were researching and developing more effective medications to treat respiratory conditions associated with excess phlegm, such as chronic obstructive pulmonary disease (COPD), asthma, and bronchitis. These medications may include novel bronchodilators, anti-inflammatory drugs, and expectorants.

The growing prevalence of chronic respiratory diseases like chronic obstructive pulmonary disease (COPD), cystic fibrosis, and bronchiectasis is driving demand for more effective, user-friendly devices. These devices help patients clear mucus from their airways without invasive procedures.

Many patients, particularly the elderly and those with chronic conditions, prefer non-invasive, comfortable solutions for managing their mucus production. As healthcare moves toward patient-centric care, non-invasive and home-use devices are becoming more popular.

The rise of digital health and remote monitoring is driven by the need for better

management of chronic diseases. Patients and healthcare providers can now track symptoms, treatment effectiveness, and device usage in real-time, improving health outcomes.
