The global Phosphorus Oxychloride for Diffusion market size is predicted to grow from US\$ 67.64 million in 2025 to US\$ 102 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Phosphorus Oxychloride (POCl₃) is commonly used in the semiconductor industry for the diffusion process. In the diffusion process, POCl₃ is used as a dopant source to introduce phosphorus atoms into silicon wafers. During the diffusion process, the silicon wafers are exposed to a high-temperature environment, and POCl₃ is vaporized and introduced into the furnace. The phosphorus atoms from POCl₃ diffuse into the silicon lattice, creating a doped region with desired electrical properties. Phosphorus Oxychloride is preferred for diffusion because it provides a controlled and uniform doping profile. It is also compatible with the silicon wafer manufacturing process and can be easily removed after diffusion. In 2025, global Phosphorus Oxychloride for Diffusion production reached approximately 39.62 K MT, with an average global market price of around US\$ 1,745 per MT.

The demand for phosphorus oxychloride for diffusion is highly related to the photovoltaic and semiconductor industries. In recent years, with the rapid growth of global photovoltaic installed capacity and the upgrading of high-efficiency battery technology, the demand for high-purity diffusion materials has continued to increase. Especially in the context of TOPCon and the promotion of efficient crystalline silicon battery technology, the requirements for the purity and stability of phosphorus oxychloride for diffusion are constantly increasing, driving the market towards high-end and large-scale development. At the same time, industry enterprises are strengthening the construction of high-purity production capacity and supply chain stability, and the Asian region, especially China, remains the most concentrated market for the production and

consumption of this product.
