The global Phosphorus Trifluoride (PF₃) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Phosphorus Trifluoride (PF₃) is an inorganic compound. It is a colorless and odorless toxic gas at room temperature and pressure. It is a colorless and transparent liquid in liquid state. It does not emit much smoke in the air. It can be used to synthesize metal organic frameworks (MOFs) and complexes. In the chemical industry, phosphorus trifluoride can be used as a synthetic raw material for certain special compounds. It can also be used to produce certain types of pesticides. In the semiconductor manufacturing process, phosphorus trifluoride can be used as a dopant to dope semiconductor materials such as silicon to change their electronic properties. Phosphorus trifluoride is highly toxic and combines with iron in hemoglobin to form a stable substance. It is highly irritating to the skin, eyes, and mucous membranes. Inhalation can cause inflammation of the upper and lower respiratory tracts and pulmonary edema. Extra caution is required when using phosphorus trifluoride. Appropriate safety measures must be taken, including the use of protective equipment and ensuring good ventilation conditions.
