A photocatalytic deodorization device is a device that deodorizes the air by oxidizing and decomposing malodorous and harmful substances through the strong oxidizing power of photocatalysts supported on the filter. Photocatalyst is effective when light strikes its surface, oxidizing and decomposing harmful substances and odor-causing substances.

As a result, it exerts deodorizing and antibacterial effects and purifies the air. Although it has an oxidizing power stronger than ozone, it is safe and does not cause harm to the human body.

Photocatalysts can be used over and over again because they are voluntarily renewable by light. It is also characterized by its ability to maintain its effectiveness with simple maintenance and the fact that it does not need to be disposed of.

The global Photocatalytic Deodorizing Device market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
