Photochromic sunglasses clip-on is an optical accessory based on photochromism technology. Its core principle is to embed photosensitive molecules (such as silver halide or organic photochromic compounds) in the lens material to make it undergo reversible molecular configuration changes under ultraviolet or short-wave visible light, thereby dynamically adjusting the transmittance. In a strong light environment, the lens transmittance can be reduced from 70%-90% in the normal state to 10%-30%, forming a shading effect similar to sunglasses; in a UV-free environment (such as indoors), the molecules restore their initial configuration and the transmittance rises, achieving convenient protection of 'one lens for two purposes'. This type of product must meet the requirements of spectral selectivity, that is, it is only sensitive to ultraviolet rays and high-energy blue light to avoid misdiscoloration caused by indoor lighting. At the same time, it must pass fatigue durability tests (such as more than 500 light-dark cycles) to ensure long-term reliability.
