Photoelectric liquid level switch is a switching device that uses a photoelectric sensor to control the switch to control the liquid level. The photoelectric liquid level switch uses infrared detection and uses the principle of refraction and reflection of light. The light will reflect or refract at the interface of two different media. When the measured liquid is at a high level, the measured liquid and the photoelectric switch form an interface. When the measured liquid is at a low level, the air and the photoelectric switch form another interface. These two interfaces make the internal light of the photoelectric switch The reflected light received by the receiving crystal has different intensities, which correspond to two different switching states.
