Photoelectric reflection sensor is an electronic device that uses a light beam to detect the presence or absence of an object. It consists of a light source and a receiver, which are located on opposite sides of the detection area. The light source emits a beam, which is reflected by the object and detected by the receiver. The sensor can detect objects according to their distance, size, shape, color and texture. It works according to the principle of reflection, which means that the object reflects part of the beam back to

the receiver. The sensor detects the reflected light and generates an output signal.
