Photogrammetry and Mesh Reconstruction Tools are software systems that convert a set of overlapping 2D images or 3D scan data into accurate 3D representations of real-world objects or environments. Photogrammetry tools analyze multiple photographs taken from different viewpoints to reconstruct camera positions and generate dense point clouds using feature matching and triangulation, while mesh reconstruction tools process these point clouds to create continuous 3D surface models (meshes) that can be textured, edited, and used in applications such as mapping, gaming, architecture, cultural heritage preservation, and digital twin creation.
