A 'Photoluminescence Scanner' is a device designed to detect and measure photoluminescence emitted by materials when exposed to light. Photoluminescence is the emission of light by a substance after it absorbs photons from an external light source. In the context of a scanner, the device typically includes a light source that illuminates the material being scanned, causing it to emit photoluminescent light. The scanner then captures and analyzes the emitted light using sensors or detectors, providing information about the material's photoluminescent properties.

The global Photoluminescence Scanner market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
