The optical time domain reflectometer is an instrument used to measure the propagation characteristics of optical signals and locate faults in optical fiber networks. It sends short pulses of optical signals along the optical fiber and measures the time and intensity of the reflected pulses to analyze the loss of the optical fiber, the location of the fault, and the performance of the entire transmission link. OTDR is widely used in the installation, maintenance, and fault diagnosis of optical fiber communication networks, helping engineers to accurately evaluate the quality and performance of optical fibers.
