PhotoMOS Optically Isolated Relay is a component that transfers electrical signals between two isolated circuits by using light. A PhotoMOS Optically Isolated Relay is a semiconductor relay with an LED as an input and MOSFET as an output. It is used in various fields to improve device reliability and reduce size. PhotoMos Optically Isolated relays find their use in the area of telecommunication, measurement & instrumentation, security devices, industrial control, Power Storage System and Medical Device. The input pins are connected to a light emitting diode which emits infrared light as soon as energized. Below the LED is an optoelectronic device that switches the output transistors. The whole unit is molded in translucent resin providing a galvanic separation between input and output.

Global PhotoMOS Optically Isolated Relay key players include Panasonic, OMRON, Toshiba, NEC, IXYS, etc. Global top five manufacturers hold a share about 70%. United States, Europe and China is the largest market, each with a share about 20%, followed by Japan, with a share about 10 percent. In terms of product, Above 20 V and Below 80 V is the largest segment, with a share about 35%. And in terms of application, the largest application is Test Measurement & Telecommunication, followed by EV & Power Storage System, Medical & Military, and Industrial & Security Device, etc.
