Photoresist for touch screens is a key material used for circuit pattern engraving in the touch screen manufacturing process. It is mainly divided into positive photoresist and negative photoresist. Its core function is to transfer the designed circuit pattern to the conductive layer (such as ITO film) through photochemical reaction, so as to achieve high-precision circuit etching and insulation protection. Positive photoresist (such as OGS touch screens used for fine line width) forms a pattern by dissolving the exposed area, which is suitable for high-resolution requirements; negative photoresist (such as used for packaging or special processes) retains the pattern through cross-linking reaction and has stronger corrosion resistance and insulation. Its characteristics include high sensitivity, uniform thickness control (deviation can be controlled within 1 μ m), excellent optical transparency and high and low temperature resistance. It is widely used in conductive layer processing, multi-layer ink layering, touch circuit protection and other links of OLED/LCD touch screens.

United States market for Photoresist for Touch Screen is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
