Photoresist Dry Film is a type of light-sensitive material used in the manufacturing of printed circuit boards (PCBs) and other microfabrication processes. It consists of a thin layer of photoresist material laminated onto a substrate, typically used to mask areas of a surface during etching or plating. When exposed to ultraviolet (UV) light through a photomask, the photoresist undergoes chemical changes that allow selective removal of either exposed or unexposed areas.

The global Photoresist Dry Film market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
