According to our LPI (LP Information) latest study, the global Photoresist Initiator (PI) market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Photoresist Initiator (PI) is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Photoresist Initiator (PI) market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Photoresist Initiator (PI) are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Photoresist Initiator (PI). Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Photoresist Initiator (PI) market.

The photoresist initiator is a key component in photoresist, which plays a role in triggering photochemical reactions during the photolithography process. The photoresist initiator can absorb the light emitted by the photolithography machine, and trigger the chemical reaction in the photoresist through the electrons or excited molecules generated by the light excitation, thereby realizing the transfer of the pattern and the definition of the pattern.

The choice of photoresist initiators depends on factors such as the type of photoresist being used, the wavelength of the light source, and the desired chemical reaction. They

play a vital role in the photolithography process, enabling high-resolution, high-precision pattern definition and transfer.
