Photosensitive cover film is a key electronic manufacturing material, widely used in the manufacturing process of printed circuit boards (PCBs) and semiconductor devices. It consists of a base film, a photosensitive layer and a cover layer, and a series of photolithography processes are used to form a precise pattern on the surface of the substrate. The specific process includes steps such as coating, exposure, development and etching. The photosensitive layer is sensitive to light and undergoes a photochemical reaction after exposure. The unexposed or exposed part is dissolved during development, thereby retaining the desired pattern.

The global Photosensitive Cover Film market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
