The report requires updating with new data and is sent in 48 hours after order is placed.

Photosensitive positioning microscope is a microscope system that uses photosensitive elements to position and image samples or target positions. This kind of microscope is usually equipped with a light-sensitive element (such as a photodiode or photosensitive device), which can sense the light signal emitted by the sample and convert it into an electrical signal for processing. By analyzing these electrical signals, the position information of the sample or target can be determined and microscopic imaging can be achieved.
