The global Photothermal Glass market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Photothermal glass is produced by the float process, which has superior physical properties, high mechanical strength and optical properties significantly better than ordinary ultra-clear glass. Photothermal glass is the basic material of the concentrator, the core basic component of solar thermal power generation, which can significantly improve the conversion efficiency of solar thermal power and meet the development requirements of the solar thermal power generation industry.

Photothermal glass is designed to enhance energy efficiency in buildings by selectively allowing or blocking solar radiation and heat transfer. As sustainability and energy efficiency continue to be paramount concerns, the demand for such advanced glass technologies may grow. Photothermal glass can be used in architectural applications, including windows, facades, and skylights, to regulate indoor temperatures and reduce the reliance on heating, cooling, and artificial lighting systems. The architecture and construction industry is a key market for these technologies.
