The global Photovoltaic Back Silver Paste market size is predicted to grow from US$ 696 million in 2025 to US$ 779 million in 2032; it is expected to grow at a CAGR of 1.7% from 2026 to 2032.

Photovoltaic silver paste is the core auxiliary material for preparing metal electrodes of photovoltaic cells, which directly affects the photoelectric performance of the cells. Photovoltaic silver paste is a mixture of high-purity silver powder as the conductive functional phase, glass oxide as the bonding phase, and an organic carrier. It is a uniform paste formed after stirring and three-roll rolling. Photovoltaic silver paste is attached to the photovoltaic cell through the screen printing process, and after drying and sintering, it forms the metal electrode of the photovoltaic cell, which can collect and conduct the surface current of the photovoltaic cell. As the key electrode material of crystalline silicon solar cells, the product performance and corresponding electrode preparation process of photovoltaic silver paste are directly related to the photoelectric performance of solar cells. It is the core auxiliary material of photovoltaic cells. According to the position of silver paste in the cell, it is divided into front silver paste and back silver paste. The front silver paste mainly collects and conducts photogenerated carriers, and the back silver paste mainly plays an adhesion role. The requirements for conductivity are relatively low. It is often used on the backlight side of P-type cells.

United States market for Photovoltaic Back Silver Paste is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Photovoltaic Back Silver Paste is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
