Abstracts

Photovoltaic coating equipment is mainly divided into evaporation coating equipment and sputtering coating equipment. The evaporation coating is often called vacuum coating, which is characterized by that under vacuum conditions, the material evaporates and condenses on the glass surface to form a film, and then after high temperature heat treatment, a film with strong adhesion is formed on the glass surface; Sputtering is a technology that uses charged particles to bombard the target surface under vacuum conditions, so that the bombarded particles can be deposited on the substrate. Sputtering coating has the advantages of strong adhesion between the film and the substrate, and good uniformity of the film.
