Photovoltaic frames are one of the important auxiliary materials of the components. They are mainly used to protect the edge of photovoltaic glass, strengthen the sealing performance of the components, and improve the mechanical strength of the components. They have an important impact on the life of the components. Photovoltaic frames are relatively important auxiliary materials for photovoltaic components. In the course of many years of development along with the photovoltaic industry, aluminum alloy materials have dominated the gold frame market with many advantages, and the current penetration rate is over 95%. Offshore photovoltaic power stations require photovoltaic component materials to have strong salt spray corrosion resistance. Aluminum is an active metal and has poor resistance to salt spray corrosion. Polyurethane composite materials have no galvanic corrosion and are a better technical solution in offshore photovoltaic power stations.

The global Photovoltaic Module Polyurethane Frame market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
