A Photovoltaic Tracking Controller is a dedicated control device used in photovoltaic tracking systems to adjust the orientation of solar modules according to the sun's position. It processes position information and operating parameters and controls motors or actuators to maintain the optimal panel angle. The controller may integrate tracking algorithms, sensors, motor drivers, communication interfaces, power management, and protection functions. It is primarily used in utility-scale and large commercial photovoltaic power plants equipped with single-axis or dual-axis tracking systems. Key product characteristics include positioning accuracy, control reliability, communication capability, environmental durability, and compatibility with different tracking structures.

The upstream industry supplies microcontrollers, sensors, motor drivers, communication modules, power components, circuit boards, connectors, enclosures, and protection components. The midstream industry integrates control electronics, tracking algorithms,

sensor interfaces, motor-control circuits, communication functions, and protection systems into finished controllers, followed by firmware configuration, calibration, and reliability testing. Products are differentiated by tracking axis, control method, positioning technology, communication interface, environmental protection level, and compatibility with tracking systems. Downstream applications include utility-scale photovoltaic plants, ground-mounted solar projects, and large commercial solar installations. Demand is driven by the expansion of tracking-based photovoltaic systems and the need to improve solar power generation efficiency.
