Physical inorganic UV filters, also known simply as inorganic UV filters or mineral UV filters, are substances used in skincare products to protect the skin from the harmful effects of ultraviolet (UV) radiation emitted by the sun. These filters operate by reflecting and scattering UV rays away from the skin's surface, rather than absorbing them like chemical UV filters. Comprising minerals such as zinc oxide or titanium dioxide, physical inorganic UV filters create a protective barrier on the skin that effectively deflects UV radiation. When applied, these minerals form a layer that acts as a shield, preventing UV rays from penetrating the skin and causing damage. Physical inorganic UV filters are often favored by individuals with sensitive skin or those prone to allergic reactions, as they are less likely to cause irritation. Moreover, they provide broad-spectrum protection against both UVA and UVB rays.

The global Physical Inorganic UV Filter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
