## Abstracts

The global Physical Treatment Anti-glare Glass market size is predicted to grow from US\$ 697 million in 2025 to US\$ 987 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Non-Reflective Glass, also called Anti-glare glass, is a kind of glass the surface of which is specially processed. The original reflective surface of the glass is turned into a matte non-reflective surface (rough surface). At present, this processing is mainly performed by spraying AG, coating AG, and chemical etching AG.

The market for Physical Treatment Anti-glare Glass is primarily driven by the growing demand for enhanced visual clarity and safety across diverse industries and applications. As glare poses significant challenges in environments such as automotive, aviation, and electronic displays, there is an increasing need for solutions that mitigate glare while maintaining optical clarity. Physical treatments applied to glass surfaces, such as etching or microtexturing, offer an effective means of reducing glare by scattering light and minimizing reflections. Additionally, advancements in manufacturing processes and materials have led to the development of physical treatment methods that provide durable and long-lasting anti-glare properties without compromising on transparency. Furthermore, the rising prevalence of electronic devices, digital signage, and architectural glass installations drives the demand for anti-glare glass solutions to enhance readability and user experience. With the ongoing focus on improving safety, comfort, and visual performance, the market for Physical Treatment Anti-glare Glass is poised for continued growth, catering to the evolving needs of industries and consumers seeking optimal visibility and glare reduction solutions.
