Phytogenics are bioactive components that function as defence mechanisms or signalling compounds within plants. Due to co-evolution, phytogenics can have physiological effects on animals by acting upon molecular receptors along the gastrointestinal tract.These receptors are present across species and are functionally important; when activated, they modulate animal immunity, physiology, metabolism and other functions. When used at the right dosage, phytogenics can be deployed as management tools to support the animal in combating many of the challenges faced in livestock production systems.Phytogenic feed additives (PFAs) are substances of plant origin added to animal diets to improve their performance, health, and well-being. Studies have shown that phytogenic combinations improve feed digestibility, increase enzyme production, and provide antioxidant effects, leading to better performance in poultry and other animals.

United States market for Phytogenic Feed Additives (PFAs) is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
