The global Picmove Interferometer market size is predicted to grow from US$ 330 million in 2025 to US$ 451 million in 2031; it is expected to grow at a CAGR of 5.4% from 2025 to 2031.

The picmove interferometer is based on the integration of a single chip in an advanced housing, enabling ultra-low noise vibration measurements. The human eye safe operating wavelength of 1.55µm provides compatibility with commercial telecommunication laser sources. The sensor design can also handle visible wavelengths to simplify beam alignment. The electrical part of the measurement system.

The accuracy and sensitivity of Picmove Interferometer are constantly improving, enabling them to be used in higher precision applications such as nanoscale displacement measurements and micromotion analysis of optical components. With the development of nanotechnology, accurate measurement of nanoparticles has become increasingly important.As a result, some automated disintegrators are beginning to focus on particle size measurement at the nanoscale. Some automated disintegrators feature automated sample handling and data analysis, making operation easier while providing higher data accuracy.Automated disintegrators are used in a variety of industries Micro-motion interferometers continue to improve in accuracy and sensitivity, allowing them to be used in higher precision applications such as nanoscale displacement measurements, micromotion analysis of optical components, and more.The new generation of Picmove Interferometer are usually multifunctional, capable of measuring micromotion and vibration in different directions and providing
