Picocells, femtocells and microcells are types of small cells. A picocell is a small cellular base station typically covering a small area, such as in-building (offices, shopping malls, train stations, stock exchanges, etc.), or more recently in-aircraft. In cellular networks, picocells are typically used to extend coverage to indoor areas where outdoor signals do not reach well, or to add network capacity in areas with very dense phone usage, such as train stations or stadiums. Picocells are operated and managed more closely by the network operator who also pays for site rental, transmission back to the core network. Femtocells are semi-autonomous, sensing from their immediate environment the best frequency and radio parameters to use, typically designed for use in a home or small business. They are installed, powered and connected by the end user or business with less active remote management by the network operator, who remains responsible for them. Microcell is a cell in a mobile phone network served by a low power cellular base station (tower), covering a limited area such as a mall, a hotel, or a transportation hub. A microcell is usually larger than a picocell, though the distinction is not always clear. A microcell uses power control to limit the radius of its coverage area.

The global Picocell, Femtocell and Microcell market size is projected to grow from US\$ 3134.3 million in 2023 to US\$ 5016.7 million in 2030; it is expected to grow at a CAGR of 7.0% from 2024 to 2030.
