Piezo-electric Air Micropumps are micropumps that use the piezoelectric effect to drive air flow. The piezoelectric effect allows certain materials to generate electrical energy when subjected to mechanical stress and vice versa, causing these materials to deform when a voltage is applied. In the piezoelectric air micropump, the piezoelectric material is used as a driving element, and the piezoelectric material is deformed by applying voltage, thereby changing the volume of the pump cavity to achieve the suction and discharge of air.

The global Piezo-electric Air Micropumps market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
