The global Piezoelectric Ceramic Active Vibration Isolator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The core material of piezoelectric ceramic active vibration isolator is piezoelectric ceramic. Piezoelectric ceramic is a crystalline ceramic whose lattice structure can be deformed under the action of electric field. This deformation will cause the charge to be displaced inside the ceramic, thereby generating a reaction force. This characteristic makes piezoelectric ceramic an ideal material for active vibration isolation. The working principle of piezoelectric ceramic active vibration isolator is based on the piezoelectric effect, especially the inverse piezoelectric effect. The inverse piezoelectric effect refers to the strain of dielectrics (such as piezoelectric ceramics) under the action of an external electric field. The magnitude of the strain is proportional to the intensity of the electric field, and the direction of the strain is related to the direction of the electric field. Therefore, when an electric field is applied to the piezoelectric ceramic, it will produce controllable strain, which can be used to offset or weaken the influence of external vibration on the system. Piezoelectric ceramic active vibration isolator can achieve active control of vibration by precisely controlling the intensity and direction of the electric field. It can not only effectively eliminate the influence of machine tool vibration and other external vibrations on processing quality, but also improve processing accuracy and workpiece surface quality. Therefore, in the field of precision machining, piezoelectric ceramic active vibration isolators have broad application prospects.
