The report requires updating with new data and is sent in 48 hours after order is placed.

The piezo-response of polymers is not as high as the response for ceramics; however, polymers hold properties that ceramics do not. Over the last few decades, non-toxic, piezoelectric polymers have been studied and applied due to their flexibility and smaller acoustical impedance. Other properties that make these materials significant include their biocompatibility, biodegradability, low cost, and low power consumption compared to other piezo-materials (ceramics, etc.). Piezoelectric polymers and non-toxic polymer composites can be used given their different physical properties.

The global Piezoelectric Polymer Materials market size is projected to grow from US\$ 135 million in 2024 to US\$ 294 million in 2030; it is expected to grow at a CAGR of 13.9% from 2024 to 2030.
