The global Piezoelectric Pressure Transmitter market size is predicted to grow from US$ 1143 million in 2025 to US$ 1470 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Piezoelectric pressure transmitter is a device that uses the piezoelectric effect of piezoelectric materials to convert the measured pressure into an electrical signal. The piezoelectric effect refers to the phenomenon that when some crystals are subjected to external pressure, polarization will occur inside them, and different positive and negative charges will be generated on the two surfaces, and the number of charges has a fixed proportional relationship with the external pressure. When the external force stops, the electrolyte returns to a non-charged state. The working principle of the piezoelectric pressure transmitter is based on the positive piezoelectric effect. When a certain external force acts on the piezoelectric material (electrolyte) to deform it, polarization will occur inside the piezoelectric material, and different positive and negative charges will be generated on its two surfaces. By measuring the number of these charges or the voltage generated, the pressure applied to the piezoelectric material can be inferred.

United States market for Piezoelectric Pressure Transmitter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Piezoelectric Pressure Transmitter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
