Piles are long, slender columns made of various materials such as steel, concrete, or wood, and they are used to provide foundational support for structures like buildings, bridges, and retaining walls. Piling driving machines are essential for ensuring that piles are properly installed to support the weight of structures and resist soil and environmental forces. Piling machines can be powered by various sources, such as diesel engines, hydraulic systems, or electric motors, depending on the type and size of the machine. These machines can drive piles made of different materials, including steel, concrete, timber, and composite materials, depending on the project requirements. Some piling machines are mounted on tracks or wheels, while others are stationary. The mobility of the machine is essential for reaching different areas of a construction site.
