The pilot-operated pressure relief safety valve is a valve for safety protection. It controls the opening and closing of the main valve through the opening and closing of the small pilot valve. When the medium pressure in the equipment or pipeline rises and exceeds

the specified value, it will automatically open. Prevent the medium pressure in the pipeline or equipment from exceeding the specified value by discharging the medium outside the system. Safety valves are automatic valves, mainly used in boilers, pressure vessels and pipelines, to control the pressure not to exceed the specified value, and play an important role in protecting personal safety and equipment operation. According to the opening height of the safety valve disc, it can be divided into micro-opening safety valve and full-opening safety valve. The opening stroke height of the micro-opening safety valve is: $\geq 0.05d_0$ (minimum discharge throat diameter); The height is $\geq 0.25d_0$ (minimum discharge throat diameter).
