The Pipe Type Ultrasonic Flow Meter is a non-intrusive flow measurement device based on the transit-time differential principle. It employs ultrasonic transducers mounted at fixed positions on the pipe to emit and receive ultrasonic signals in both upstream and downstream directions, calculating flow rate through the linear relationship between the time difference of sound wave propagation and fluid velocity. Its advantages include high-precision measurement without pipeline modification, applicability to large-diameter pipes and complex fluid conditions (e.g., corrosive media, high-temperature steam), long-term stability, and low maintenance requirements. It is widely used in energy, chemical, and municipal water supply industries.
