Abstracts

The global Pipeline Micro Hydropower System market size is predicted to grow from US\$ 181 million in 2025 to US\$ 258 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

A Pipeline Micro Hydropower System is a small-scale hydropower solution that generates electricity by harnessing the flow of water through existing pipelines or pressurized water networks, such as municipal water supply lines or irrigation channels. Unlike conventional hydropower plants, it does not require large dams or extensive civil works, making it suitable for decentralized power generation. The system typically consists of a turbine installed directly in the pipeline, a generator to convert mechanical energy into electricity, and control and monitoring equipment to manage flow and output. These systems are often used in remote or off-grid locations, industrial facilities, and rural communities to provide clean, renewable energy with minimal environmental impact, leveraging water that is already being transported for other purposes.

The growth of the pipeline micro-hydropower system market is primarily driven by factors such as energy-efficiency upgrades to water supply networks, the utilization of distributed clean energy, the recovery of residual pressure resources, and the ongoing development of smart water systems. Municipal water supply, industrial circulating water, agricultural irrigation, wastewater treatment, and building water supply systems contain numerous pipeline nodes where continuous flow requires pressure reduction; while traditional pressure-reducing valves typically dissipate this hydraulic energy, pipeline micro-hydropower systems utilize micro-turbines, pumps operating in reverse, and generators to convert residual pressure and flow energy into electricity. This enables energy recovery without significantly compromising the original water supply function, thereby helping water utilities and industrial users lower external electricity

costs and reduce carbon emissions. Furthermore, as these systems are typically deployed directly within existing pipeline networks—eliminating the need for large dams or complex water diversion infrastructure—they offer advantages such as a small footprint, minimal environmental impact, relatively short construction periods, and flexible distributed deployment.
