The global Pirenzepine Hydrochloride market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Pirenzepine hydrochloride is a selective M1 cholinergic receptor antagonist, mainly used to treat peptic ulcer and diseases related to excessive gastric acid secretion. It inhibits the secretion of gastric acid and pepsin, reduces the erosion of gastric acid on the gastric mucosa, and promotes ulcer healing. This drug is commonly used to treat digestive system diseases such as gastric ulcer and duodenal ulcer, and is especially suitable for stomach discomfort caused by excessive gastric acid secretion.

As a selective M1 cholinergic receptor antagonist, pirenzepine hydrochloride plays an important role in the treatment of peptic ulcers. It helps reduce gastric acid damage to the gastric mucosa and accelerates ulcer healing by inhibiting the secretion of gastric acid and pepsin. Compared with traditional anti-ulcer drugs, the selective effect of pirenzepine makes it have fewer side effects, especially the effects on the cardiovascular system and nervous system are relatively small. However, despite its obvious advantages, individual differences still need to be paid attention to during treatment, and some patients may experience side effects such as dry mouth and blurred vision.
