The PIT tag antenna is a wireless radio frequency device used to read PIT tags. It is widely used in fields such as wildlife tracking, aquaculture, and experimental ecology. The PIT tag itself does not contain a power source and relies on the electromagnetic field emitted by the antenna for activation. When an individual with a PIT tag passes through the antenna sensing area, the tag is activated and returns a unique identification code. The antenna receives the signal and transmits it to the data recording system. This type of antenna is generally composed of a coil and can be installed in waterways, nest box entrances, fence passages, etc., to achieve non-contact, continuous, and automated identification and monitoring of target individuals. It has the advantages of high identification accuracy and strong data traceability.

United States market for PIT Tag Antennas is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
