Abstracts

The global PLA Paper Cup market size is predicted to grow from US$ 1016 million in 2025 to US$ 1747 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

PLA paper cup is a disposable paper beverage container made of food grade cardboard as the cup substrate, and coated with polylactic acid film on the inner or outer walls. PLA is a bio based polymer prepared from renewable plant resources such as corn and sugarcane, mainly used to replace traditional polyethylene film and provide waterproof, oil resistant, and barrier properties for paper cups. PLA paper cups typically include single-layer cups, double-layer cups, corrugated cups, and single-sided or double-sided PLA coated cups, which can be used for coffee, tea, juice, cold drinks, and other dining beverages. In industrial composting facilities that meet appropriate temperature, humidity, and microbial conditions, certified PLA paper cups can be compostable, but their paper fibers and PLA coatings still require matching recycling or composting systems, which cannot be simply equated with rapid degradation in natural environments.

> In 2025, global PLA Paper Cup production reached approximately 13,852 M Units, with an average global market price of around US$ 75 per k unit.

The PLA paper cup market is being jointly driven by plastic restriction policies, low-carbon transformation of catering packaging, growth in chain coffee and takeaway consumption, and requirements for sustainable brand procurement. Traditional polyethylene coated paper cups require paper plastic separation during the recycling process, while PLA paper cups provide a clear environmentally friendly packaging alternative for catering enterprises through their bio based materials and industrial composting properties. Therefore, their application is gradually expanding in coffee

shops, tea beverage chains, aviation catering, hotels, offices, and large-scale events. The future market competition will not only focus on the content of PLA materials, but also pay more attention to heat resistance, cup sealing strength, coating uniformity, printing adaptability, food contact safety, composting certification, and large-scale supply capacity. The current industry still faces problems such as PLA raw material costs being higher than ordinary polyethylene, limited high temperature resistance and long-term barrier performance, insufficient coverage of industrial composting facilities, and an imperfect terminal classification system. With the continuous development of heat-resistant PLA modification, low weight coating, non plastic coating, and paper cup recycling technology, PLA paper cups will enter more markets with clear environmental procurement standards and centralized recycling conditions. However, their long-term competitiveness still depends on the reduction of material costs, unified certification systems, and the improvement of end of pipe treatment infrastructure.
