The global Planar Cavity-Backed Spiral Antennas market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The planar cavity-backed spiral antenna is a modified spiral antenna that combines a planar spiral antenna structure with a cavity-backed reflector. This design effectively enhances the antenna's directivity, gain, and broadband performance by arranging the spiral structure on a plane and equipping it with a cavity-backed reflector. The addition of the cavity-backed reflector allows the antenna to radiate energy in one direction, improving efficiency while suppressing back radiation. This type of antenna is often used in scenarios where space is limited but high gain and directivity are required, such as satellite communications, radar systems, and some high-frequency radio equipment.

United States market for Planar Cavity-Backed Spiral Antennas is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
