## Abstracts

The global Plant-based Incomplete Protein market size is predicted to grow from US\$ 5165 million in 2025 to US\$ 7445 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

A plant-based incomplete protein is a type of protein derived from plant sources that does not contain all nine essential amino acids in sufficient amounts required by the human body. Unlike complete proteins, which provide all essential amino acids (often found in animal products), incomplete proteins may lack one or more of these amino acids. Common sources of incomplete proteins include grains, legumes, nuts, seeds, and vegetables. While individuals can still obtain adequate protein from these sources, it often requires combining different plant foods (such as beans and rice) to achieve a complete amino acid profile. This approach is important for vegetarians and vegans to ensure they meet their nutritional needs.
