The global Plant Exogenous Hormones market size is predicted to grow from US\$ 5254 million in 2025 to US\$ 8851 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

Plant exogenous hormones are synthetic or naturally derived substances applied externally to plants to regulate various physiological processes and promote growth. These hormones, which include auxins, gibberellins, cytokinins, ethylene, and abscisic acid, can influence a range of functions such as cell division, elongation, fruit ripening, and stress responses. By mimicking or enhancing the effects of natural plant hormones, exogenous hormones are used in agricultural practices to improve crop yield, control flowering and fruit development, and enhance overall plant health, making them valuable tools in horticulture and crop management.

The market for plant exogenous hormones is experiencing steady growth, driven by increasing agricultural productivity demands and the need for sustainable farming practices. As global populations rise, farmers are under pressure to enhance crop yields while minimizing environmental impacts. Exogenous hormones, such as auxins, gibberellins, and cytokinins, offer effective solutions for optimizing plant growth and development, making them essential tools in modern agriculture.

Recent advancements in research and technology have further propelled the market for plant exogenous hormones. Innovative formulations and application methods, such as controlled-release technologies and microencapsulation, are enhancing the effectiveness and usability of these products. Additionally, the increasing focus on organic farming practices is driving interest in naturally derived exogenous hormones, as consumers demand more sustainable and eco-friendly agricultural practices. This

shift is prompting manufacturers to expand their product lines to include organic and biostimulant options, catering to diverse market preferences.

Moreover, the global shift towards integrated pest and nutrient management is influencing the adoption of plant exogenous hormones. As farmers seek holistic approaches to optimize crop health and resilience, these hormones are increasingly being used in conjunction with other agricultural inputs, such as fertilizers and biopesticides. The synergy created by combining exogenous hormones with other sustainable practices enhances overall crop performance and pest resistance. As awareness of the benefits of plant exogenous hormones continues to grow among farmers and agronomists, the market is expected to expand, driven by the need for effective solutions in the face of climate change and agricultural challenges.
